A basic problem frame : required behaviour

There is some part of the physical world whose behaviour is to be controlled so that it satisfies certain conditions. The problem is to build a machine that will impose that control.

- ▶ embedded systems
- ▶ sensors (C2) and actuators (C1)

A basic problem frame : required behaviour

- ▶ **embedded systems**
- ▶ **sensors (C2)** and **actuators (C1)**

Example : A machine that keeps the temperature of some liquid between given bounds. Then, the temperature of the liquid would be a shared phenomenon controlled by the environment. The corresponding sensor would be a thermometer. Another shared phenomenon would be the state of a burner. That state would be controlled by the machine, i.e., the machine is able to switch the burner on or off.

A basic problem frame : transformation

There are some computer-readable input files whose data must be transformed to give certain required output files. The output data must be in a particular format, and it must be derived from the input data according to certain rules. The problem is to build a machine that will produce the required outputs from the inputs.

Lift System Case Study

A lift system consists of a lift plant (that is the cabin, the motor moving it and the doors at the various floors), some software automatically controlling the lift functioning (the controller), and the people using it (the users). The controller monitors the lift plant by means of sensors, which communicate the status of its various components (e.g., there is a sensor detecting the position of the cabin), and directs its behaviour by means of orders (e.g., it can order to open/close the doors).

Commanded Behaviour : Domain Model

The *Controlled domain*

- is equipped with some **sensors**
→ public attributes `sensor1, ..., sensork`
- is controlled by **pulses** → interface operations `Pulses`
- may change its state and functioning,
“**autonomous**” activities → `auto1, ..., autoh`
- other **private attributes** may be used to describe its state

Commanded Behaviour : Domain Model

The *Controlled domain*

- is equipped with some **sensors**
→ public attributes $sensor_1, \dots, sensor_k$
- is controlled by **pulses** → interface operations **Pulses**
- may change its state and functioning,
“autonomous” activities → $auto_1, \dots, auto_h$
- other **private attributes** may be used to describe its state
- if a value signalled by sensors is derived from attributes,
invariant constraints

Commanded Behaviour : Domain Model

The *Controlled domain*

- is equipped with some **sensors**
→ public attributes $sensor_1, \dots, sensor_k$
- is controlled by **pulses** → interface operations **Pulses**
- may change its state and functioning,
“autonomous” activities → $auto_1, \dots, auto_h$
- other **private attributes** may be used to describe its state
- if a value signalled by sensors is derived from attributes,
invariant constraints
- behaviour : statechart, events $(pulse_i, auto_j)$, attributes
and

The Commanded Information frame

*C1 phenomena are referred to later as Events issued by the Real world
E1 are Enquiries from the Enquiry operator*

*E2 are Display Acts and Error Messages
displayed by the Answering Machine to the Enquiry Operator*

There is some part of the physical world about whose states and behaviour information is needed upon requests from the operator. The problem is to build a machine that will obtain this information from the world and present it at the required place in the required form.

notation

The Company is a commercial one selling products of various kinds, produced by someone else.

The orders are received from outside, and from time to time they are examined. If the ordered products are available in the required quantity the order is processed, an invoice is sent to the client and the goods are shipped, otherwise the order will be examined again in the future. If the ordered products are not available for a long time, the order is refused. A client may cancel an order before it is processed. From time to time the products are supplied by the producers and stocked by the Company.

The Company product catalog may change, that is products may be removed and new ones added.

Conclusions

- ▶ a software development approach
 1. match with a (basic or variant) problem frame (check IST paper for the Required behaviour frame)
 2. model the various frames parts following the proposed UML diagrams
- ▶ problem frames are very good at providing a **first requirement structure** that is invaluable to start the analysis of a problem and understand its nature. A means to **reuse experience** helpful to start a complex problem analysis with some structuring concepts in mind.
